Calculus - Late Transcendental (LT)

Course Description:

This calculus course is at least a 3-credit course and consists of the algebraic, graphic, numeric, and modeling approach to the study of calculus, with or without technology, and with appropriate symbolic manipulation. The course includes the use of appropriate mathematical language, including symbolism, to define, evaluate, and analyze the characteristics of calculus concepts. It includes solving problems involving the techniques of calculus and applications of calculus. **At least 70% of the course time must be spent on all essential topics.**

Essential topics:

- Limits (including limits at infinity and one-sided limits)
- Statement of limit properties (such as limit of a constant, sum, product, or quotient)
- Continuity (including an intuitive understanding and continuity in terms of limits)
- Definitions of the derivative
- Relationship between differentiability and continuity
- Derivatives of elementary algebraic functions
- Curve sketching (such as increasing and decreasing functions; relative and absolute maximum and minimum points; concavity; points of inflection; and corresponding characteristics of f , f', and f'')
- Applications of the derivative (such as slope of a curve at a point, optimization, related rates)
- Derivatives of sums, differences, products, and quotients
- Derivative of a composite function (chain rule)
- Implicit differentiation
- Derivative of the inverse of a function
- Higher order derivatives
- Derivatives of trigonometric functions
- Differentials and Linear Approximation
- Mean Value Theorem
- Use of L'Hopital's Rule
- Concept of antiderivatives
- Basic integration formulas
- Application of antiderivatives (such as distance & velocity from acceleration, & growth & decay)
- Definition of a definite integral (limit of a sequence of Riemann sums)
- Approximations of the definite integral (using areas of rectangles)
- Properties of the definite integral
- The Fundamental Theorem of Calculus
- Applications of the definite integral
- Integration by substitution (using identities and change of variables)

Additional optional topics:

- Derivatives of exponential functions
- Derivatives of logarithmic functions

***NOTE:** A transferable calculus course can have as its main focus the study of algebraic functions (functions that can be built up by the usual algebraic operations of addition, subtraction, multiplication, division, and raising to constant powers). It is recommended that students in a LT Calculus I complete a LT Calculus II course

Template for Course Inventory

Please fill out the following table and submit attachment(s). Approved courses must be resubmitted every 5 years.

Please attach the following materials:

- Current working syllabus and lab syllabus that contains instructional goals and/or objectives
- Comprehensive final; in the absence of a comprehensive final no more than 5 sample assessments

Percentage Grand Total:	0.00

Additional Comments:

Check if addressed:

☐	Current working syllabus and lab syllabus that contains instructional goals and/or objectives
☐	Comprehensive final; in the absence of a comprehensive final no more than 5 sample assessments
☐	Every essential topic has been addressed
☐	At least 70% of the course time must be spent on all the essential topics
☐	Percentages of topics must total 100%
☐	Course is at least 3-credit
